

## What's new?

We are delighted to announce that we have added a "full order entry" module for COV2PCR tests. This means that you will now be able to electronically capture all patient and sample details when logging a requisition. The "scan barcode only" process will still apply to other tests. **Please see the shared [training manual](#) for more information.**

**Note that not all facilities will have access to this module. Facilities will be informed before the module is activated for them.**

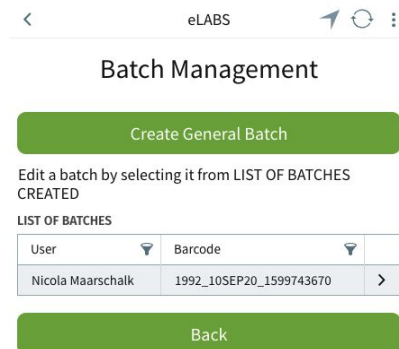

This update will be available on your eLABS application from **14-10-2020, 17:00**.

Facilities without full order entry permission will note the following changes that were made to the current workflow:

### Mobile: HCF

#### Batch Management

We have changed the fields that are displayed when you create a batch. You are now able to see who created the batch along with the batch barcode.

User	Barcode	
Nicola Maarschalk	1992_10SEP20_1599743670	>

## Sample Management

We have added a screen where the test type for the samples (you are about to scan) will be selected. For now this screen will default to "General" as test types are only indicated when the full order entry module is activated. We have also added a column to indicate the test type of a sample. This will come in handy when full order entry is activated.
